anthranilate phosphoribosyltransferase (EC 2.4.2.18) - garden pea (fragment)
N;Alternate names: phosphoribosylanthranilate transferase
C;Species: Pisum sativum (garden pea)
C;Species: Pisum sativum (garden pea)
C;Accession: T06460
R;Sato, N.; Kazuno, A.; Ohta, N.; Ohshima, K.
submitted to the RMLD Bata Library, June 1996
A;Description: Isolation of a pea cDNA for phosphoribosylanthranilate transferase.
A;Reference number: 215694
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention relates to an isolated and purified ApoptoM peptide. The invention is useful as a vaccine for the prevention and treatment of pathological conditions from non-specific febrile illnesses pathological conditions, encephalitic syndromes and these pathological conditions are linked to Flavivirus infection or cancers. The invention is also useful in gene therapy. The present sequence is a M1-40/DEN (dengue)-2 (F36) mutant protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

ADW12582

```
The invention relates to a secretory polynucleotide (designated sptm)

comprising any of 567 polynucleotide sequences (ABZ35837-ABZ36403), a

actually occurring polynucleotide sequence at least 90 % identical to

the polynucleotide sequence, a polynucleotide complementary to them or an

RNA equivalent of them. The polypeptide or polynucleotide are useful for

treating, preventing or diagnosing a disease or condition associated with

the expression of functional SPTM. These are particularly useful for

diagnosing, treating or preventing autoimmune/inflammatory disorders

(e.g. acquired immunodeficiency syndrome, anaemia, asthma or Crohn's

disease), neurological disorders (e.g. epplepsy, Huntington's disease,

dementia, stroke, Alzheimer's disease, Creutzfeldt-Jakob disease,

conticpirenia or amnesia), or cell proliferative disease, anxiety,

schizopirenia or amnesia), or cell proliferative disease, anxiety,

conticpirenia or amnesia), or cell proliferative disease,

leukaemia, lymphoma, melanoma, myeloma, sarcoma or cancers of the brain,

correat, cervix or prostate). The present sequence is one of the SPTM

proteins of the invention (ABP75384-ABP75962). Note: The sequence data

corrections of the circum part of the printed specification, but was

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                 The present invention relates to an isolated and purified ApoptoM peptide. The invention is useful as a vaccine for the prevention and treatment of pathological conditions from non-specific febrile illnesses to severe hemorrhagic manifestations, encephalitic syndromes and these pathological conditions are linked to Flavivirus infection or cancers. The invention is also useful in gene therapy. The present sequence is a p(95-114) EGFP (enhanced green fluorescent protein) (M1-M40) DEN (dengue) -2 (136F) plasmid DNA encoded protein.
                                                                                                                                                                                                                         New isolated and purified ApoptoM peptide comprises 9 amino acids, useful as a vacaine for preventing or treating pathological conditions from nonspecific febrile illnesses to severe hemorrhagic manifestations or encephalitic syndromes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human; SPTM; autoimmune disorder; inflammatory disorder; AIDS; anaemia; asthma, Crohn's disease; neurological disorder; epilepsy; cancer; Huntington's disease; Alzheimer's disease; Creutzfeldt-Jakob disease; multiple, sclerosis; Parkinson's disease; cell proliferative disorder;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                           This invention relates to a novel isolated polynucleotide comprising a nucleotide sequence selected from one of 1680 sequences, a mature protein coding portion of them, an active domain of them and thehat complementary sequences. The invention may be useful for the production of compounds with an antiarthritic, antiparkinsonian, neuroprotective, nootropic, immunosuppressive, cytostatic, antipsoriatic, antinflammatory, antibaction, the disclosed sequences may be useful for gene therapy. The polypeptides or their antibodies are useful for treating many diseases such as archritis, Parkinson's, Alzheimer's, autoimmune diseases, cancer, psoriasis, inflammatory bowel disease and infections caused by bacteria, viruses, fungi or parasites. The present sequence is that of a human polypeptide of the invention.
                                                                                                                                                                                                           Isolated polynucleotide encoding bone marrow derived polypeptides useful for treating, e.g., Parkinson's, Alzheimer's, cancer, arthritis, Crohn's disease, and inflammatory bowel disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human; NOV; antidiabetic; anorectic; antibacterial; virucide; immunomodulator; cytostatic; nootropic; neuroprotective; dyalipidaemia; antiparkinsonian; antilipaemic; gene therapy; metabolic disorder; diabetes; obesity; infection; cachaxia; cancer; Parkinson's disease; neurodegenerative disorder; Alzheimer's disease; immune disorder;

```
The present invention relates to novel human NOV proteins and their coding sequences (ACC72075-ACC72181 and ABRS8365-ABRS8465). The NOV proteins are useful in manufacturing a medicament for treating a syndrome associated with a human disease. The NOV proteins and coding sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             NOVX polypeptides and nucleic acids useful for diagnosing, preventing or treating NOVX-associated disorders, e.g. diabetes, obesity, cancer or dyslipidemia, and in chromosome mapping, tissue typing or pharmacogenomics.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     may be used to diagnose, treat or prevent metabolic disorders such as diabetes or obesity, infections, cachexia, cancer, neurodegenerative disorders such as Alzheimer's disease or Parkinson's disease, immune disorders, haematopoietic disorders and various dyslipidaemias
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Alsobrook JP, Anderson DW, Boldog FL, Burgess CE, Catterton E; Edinger SR, Ellerman K, Gerlach VL, Gorman L, Guo X, Ji W; Edkuda K, Leach MD, Li L, Miller CE, Patturajan M, Rieger DK; Rothenberg ME, Shimkers RA, Smithson G, Spytek KA, Taupier RJ; Vernet CAM, Voss EZ, Zerhusen BD, Zhong M;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to novel genes (ABL89449-ABL90853) and proteins (ABB89940-ABB90444) useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. The genes are isolated from a range of human tissues disclosed in the specification. The nucleic acids, proteins, antibodies and (ant) agonists are useful in the diagnosis, treatment and prevention of: (a) cancer, e.g. breast and ovarian cancer and other cancers of the adrenal gland, bone, bone marrow, breast, gastrointestinal tract, liver, lung, or urogenital; (b) immune disorders e.g. Addison's disease, allergies, autoimmune hemolytic anaemia, autoimmune thyroiditis, diabetes mellitus, Crohn's disease, cardiovascular disorders such as mycardial ischaemias; (d) wound healing; (e) neurological diseases euch as mycardial ischaemias; (d) wound healing infectious diseases such as viral, bacterial, fungal and parasitic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö

The invention relates to human nucleic acids (AAI57798-AAI61369) and the encoded polypeptides (AAM38642-AAM42213) with nootropic, immunosuppressant and cytostatic acitvity. The polymucleotides are useful in gene therapy. A composition containing a polypeptide or polymucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral nervous is system, such as peripheral nervous system diseases, such as localised neuropathies and central nervous system diseases, such as alzheimer's, Parkinson's disease, Huntington's disease, amyotrophic contains and Shy-Darger Syndrome. Other uses include the utilisation of the activities such as: Immune system suppression, Activin/inhibin activity, chemoteatic/chemokinetic activity, haemostatic and thrombolytic activity, chemoteatic/chemokinetic activity, haemostatic and thrombolytic activity, cancer diagnosis and therapy, drug screening, assays for receptor activity, arthritis and inflammation, leukaemias and C.N.S disorders. Note: The sequence data for this patent did not form part of the printed specification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Wang D;

Novel nucleic acids encoding PRO polypeptides, used to diagnose the presence of tumors, such as prostate and breast tumors, in mammals and to screen for modulators of the compounds.

Gurney AL;

Claim 11; Fig 66; 774pp; English

Sequences AAU29024-AAU29328 represent PRO polypeptides of the invention. The PRO polypeptides and their associated nucleic acids can be used to detect the presence of a tumour in a mammal by comparing the level of expression of a PRO polypeptide in a test sample of calls from the animal and a control sample of normal cells, whereby a higher level of expression in the test sample indicates the presence of a tumour in the mammal. Mammals include dogs, cats, cattle, horses, sheep, pigs, goats

I, Zhao QA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to human nucleic acids (AAI57798-AAI61369) and the encoded polypeptides (AAM38642-AAM42213) with nootropic, immunosuppressant and cytostatic activity. The polynucleotides are useful
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Novel nucleic acids and polypeptides, useful for treating disorders such
and rabbits but are preferably human. The polypeptides can be used to stimulate tumour necrosis factor (TNF) alpha release from human blood, when contacted with it. A specific polypeptide can be used to stimulate the proliferation or differentiation of chondrocyte cells. The PRO proteins can be used to determine the presence of tumours and also susceptibility to tumour development, particularly adrenal, lung, colon, breast, prostate, rectal, cervical, or liver tumours, in mammalian subjects. The oligonucleotide probes specific for the PRO nucleic acids can be used for genetic analysis of individuals with genetic disorders
                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human; nootropic; immunosuppressant; cytostatic; gene therapy; cancer; peripheral nervous system; neuropathy; central nervous system; CNS; Alzheimer's; Parkinson's disease; Huntington's disease; haemostatic; amyotrophic lateral sclerosls; Shy-Drager Syndrome; chemotactic; chrombolytic; drug screening; arthritis; inflammation;
                                                                                                                                                                                                          Gaps

                                                                                                                                                                                                                                                                                                                                                                                                          ò
                                                                                                                                                                                                                                                                              ö
in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral nervous to a such as peripheral nervous injuries, peripheral nervous focalised neuropathies and central nervous system diseases, such as Alzheimer's, Parkinson's disease, Huntington's disease, amyotrophic atteral sclerosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activities such as: Immune system suppression, Activin/inhibin activity, chemotactic/chemokinetic activity, haemostatic and thrombolytic activity, cancer disgnosis and therapy, drug screening, assays for receptor activity, arthritis and inflammation, leukaemias and C.N.S disorders. Note: The sequence data for this patent did not form part of the printed specification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Eighty four nucleic acids encoding PRO polypeptides, useful in molecular biology, including use as hybridization probes, and in chromosome and

                transmembrane). The PRO protein, and PRO agonists, PRO antagonists or anti-PRO antibodies are useful for preparation of a medicament useful in the treatment of a condition which is responsive to the PRO protein, agonists, antagonists or anti-PRO antibodies. The PRO protein may also be employed as molecular weight markers for protein electrophoresis. The PRO coding sequence has applications in molecular biology, including use as hybridisation probes, and in chromosome and gene mapping
                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human, secreted protein, transmembrane protein, antirheumatic,

New isolated secreted and transmembrane PRO polypeptide useful for modulating biological activity of a cell, or for treating sports-related joint problems, osteoarthritis or rheumatoid arthritis.

20; Fig 14; 399pp; English. Claim The invention relates to an isolated secreted and transmembrane PRO Polypeptide having 80 % sequence identity to a sequence appearing as ABG95881-ABG95914 or their associated signal peptide, or a sequence of an extracellular domain of the proteins with their associated signal peptide or lacking its associated signal peptide. Also included are the nucleic acids encoding the proteins, vectors, host cells, tusion proteins and antibodies which specifically bind to the proteins. The proteins are useful for detecting a polypeptide designated as A, B, C or D in a sample suspected of contraining an A, B, C or D polypeptide, by contacting the sample with a polypeptide designated as E, F, G, H or I (or vice versa) and determining the formation of a A/E, B/F, B/G, C/H or D/I polypeptide

conjugate in the sample, where the formation of the conjugate is indicative of the presence of an A, B, C or D polypeptide in the sample, where A is a PRO10272 polypeptide, B is a PRO5010 polypeptide, C is a C PRO10295 polypeptide, D is a PRO10296 polypeptide, E is a PRO5060 polypeptide, E is a PRO5060 polypeptide, E is a PRO5060 polypeptide, H is a C PRO2023 polypeptide b is a PRO1090 polypeptide. The sample comprises a cell suspected of expressing the A, B, C or D polypeptide. The E, F, G, C H or I polypeptide is labeled with a detectable label or is attached to a solid support. The proteins are useful for linking a bioactive molecule cor a cell expressing a polypeptide designated as A, B, C or D or E, F, G, H or I. The bioactive molecule is a toxin, a radiolabel or an antibody. The bioactive molecule sa toxin, a radiolabel or an antibody. CC or I, or antibodies against them are useful for modulating a biological activity of a cell expressing a polypeptide designated as A, B, C or D or E, F, G, H, or I. The cell is killed. The proteins are useful for useful in the treatment of a condition which is responsive to the proteins, as molecular weight markers for protein selectrophoresis problems, articular cartilage defects, osteoarthritis or rheumatoid arthritis. Nucleic acids encoding the protein selecting to cheunistication, and in Grant Propagation of the proteins, to charagenic or knockout animals which are useful in the development and screening of therapeutic useful as a condition with a description of the proteins are useful in the cell and gene mapping, in the generation of the proteins are useful in the protein from recombinant cell culture natural sources. The present convention in a diagnostic assay and for affinity purification of invention ö Gaps ö 66.7%; Score 6; DB 5; Length 234; 100.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ABL88072 to ABL88258 encode the PRO proteins given in ABB84817 to ABB85003. The PRO proteins and polymucleotides have cardiant, cytostatic, antiangiogenic, hypotensive, vulnerary and antiarteriosclerotic activities, and can be used in gene therapy. The PRO polymucleotides, proteins, agonists and antagonists are useful for treating or diagnosing cardiac hypertrophy, trauma, cangiogenic disorder in a mammal, e.g. cardiac hypertrophy, trauma, cancer, age-related macular degeneration, atherosclerosis, hypertension, arterial restenosis, rheumatoid arthritis, angina, mycoardial infarctions, thrombophlebitis, lymphangitis, tummour angiogenesis (such as breast carcinoma and liver carcinoma) and wound healing. The PRO polymucleotides have applications in molecular biology, including use as hybridisation probes, and in chromosome and gene mapping. ABL88259 to ABL8826, represent primers and probes used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Baker KP, Ferrara N, Gerber H, Gerritsen ME, Goddard A;

                                                                                                                                                                                                                                                                 The present invention provides the protein and coding sequences of human PRO proteins. These are useful for treating or diagnosing a cardiovascular, endothelial or angiogenic disorder, including cardiac hypertrophy, trauma, cancer, age-related macular degeneration, atherosclerosis, hypertension, arterial restenosis, rheumatoid arthritis, angina, mycoardial infarctions, thrombophiebitis, lymphangitis, tumour angiogenesis (such as breast carcinoma and liver carcinoma) and wound healing. The present sequence is a PRO protein of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human, PRO, cytostatic, tumour, cancer, breast, lung, stomach, liver,
dog, cat, cow, horse, sheep, pig, goat, rabbit, ADEPT,
antibody-dependent enzyme mediated prodrug therapy.

The invention also relates to a method for stimulating the release of tumour necrosis factor alpha (TWF-alpha) from human blood by contacting the brood with a sequence of the invention, a method for stimulating the proliferation or differentiation of chondrocyte cells by contacting the cells with a PRO polypeptide and a method for detecting the presence of tumour in a mammal. The polypeptides and polynucleotides are useful for the mammal. Sequence and sequence dispensing or treating a tumour in a mammal. The sequence data for this patent is also available in electronic format from USPTO at seqdata.uspto.gov/sequence.html
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human; secreted and transmembrane protein; PRO; cytostatic; gene therapy; chondrocyte stimulator; tumour; adrenal tumour; lung tumour; colon tumour; breast tumour; prostate tumour; rectal tumour; tumour; tumour; TNR-alpha release; tumour; actor alpha release; chondrocyte cell differentiation; chondrocyte cell differentiation; bharmaceutical; diagnostic; biosensor; bioreactor.
                                                                                                                                                                                                                                                              Three hundred and five nucleic acids encoding PRO polypeptides, useful for the manufacture of a medicament for diagnosing or treating tumor.

Three hundred and five nucleic acids encoding PRO polypeptides, useful in gene therapy, chromosome identification, tissue typing, and for detecting the presence of tumor in a mammal.

Claim 11; Fig 66; 707pp; English

The invention relates to three hundred and five nucleic acids encoding
PRO polypeptides (secreted and transmembrane), sequences 80% identical to
them, or encoding a PRO polypeptide lacking its associated signal peptide
or an extracellular domain of the PRO polypeptide, with or lacking its
associated signal peptide. Also included are the encoded PRO proteins,
PRO expression vectors, host cells transformed with the vector (used to
produce PRO proteins), a chimaeric molecule comprising the PRO
polypeptide fused to a heterologous amino acid sequence, an anti-PRO
antibody, a method for stimulating the release of tumor necrosis factor
antibody, a method for stimulating the proliferation or differentiation
CRO 47NP-a1DADA from buoma Disod (by contecting the blood with PRO1079,
PRO827, PRO791, PRO1131, PRO1131, PRO1183, PRO1343, PRO1567 or
PRO4333), a method for stimulating the proliferation or differentiation
CRO 6 chondrocyte cells by contacting the cells with a PRO6029 polypeptide,
a method for detecting the presence of tumour in a mammal and an
coligonucleotide probe derived from any of the nucleotide sequences cited
above. The PRO polypeptide or anti-PRO antibody is useful for preparing a

99WO-US031274

```
medicament for treating a condition that is responsive to the PRO polypeptide or anti-PRO antibody. The PRO nucleotide sequences are useful as hybridisation probes in chromosome and gene mapping, or in generating antisense RNA and DNA. PRO nucleic acids are also useful in preparing PRO polypeptides, in assays to identify other proteins or molecules involved in a binding reaction, to generate transgenic animals or knockout animals, which in turn are useful in the development and screening of therapeutically useful reagents, for chromosome identification, and therapeutically useful reagents, for chromosome identification, and therapeutically useful the presence of a tumour in a mammal, stimulating proliferation or differentiation of chondrocyte cells, stimulating the release of tumour necrosis factor-alpha from human blood, in gene release of tumour necrosis factor-alpha from human blood, in gene cherapy, or as molecular weight markers for protein electrophoresis purposes. The anti-PRO antibodies may be used in diagnostic assays for PRO, or for the affinity purification of PRO from recombinant cell
                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human, secreted and transmembrane protein, PRO, TNP-alpha,

transmembrane (RRO) polypeptides. Also disclosed is an antibody that specifically binds to the PRO polypeptide, a method for stimulating the specifically binds to the PRO polypeptide, a method for stimulating the release of tumnour necrosis factor alpha (TNF-alpha) from human blood by contacting the blood a PRO polypeptide, a method for stimulating the proliferation or differentiation of chondrocyte cells by contacting the presence of a tumnour in a mammal and an oligonucleotide probe derived from any of the PRO nucleotide sequences. The nucleotide sequences are useful as probes, in chromosome and gene mapping, in generating antisense RNA and DNA, in preparing PRO polypeptides by recombinant techniques and in gene therapy (e.g. for replacement of defective gene). The PRO polypeptides are useful as molecular weight markers for protein electrophoresis purposes, for chromosome identification, as chromosome markers, se therapeutic agents, for stimulating the release of TNF-alpha from human blood, for stimulating the proliferation or differentiation of chondrocytes and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New secreted and transmembrane PRO polypeptides and nucleic acids, useful in gene therapy, in chromosome and gene mapping, as chromosome markers, in tissue typing, and in chromosome identification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Godowski PJ, Gurney AL;

The invention describes an antibody that specifically binds to a PRO polypeptide having a fully defined amino acid sequence given in the specification. The antibody is useful in identifying PRO polypeptides bescul for various industrial applications, including pharmaceuticals, diagnostics, biosensors and bioreactors. The antibody is also used for affinity purification of PRO polypeptides from recombinant cell culture or natural sources. The antibody, PRO polypeptide, or its agonists or antagonists, may be used for preparing a medicament for diagnosing or treating a condition responsive to the antibody, PRO polypeptide, or its agonists or antagonists. This is the amino acid sequence of a novel human secreted and transmembrane PRO polypeptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human; secreted/transmembrane protein; PRO; tumour; cancer; cytostatic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New antibody useful for identifying PRO polypeptides, for affinity purification of PRO polypeptides, and for preparing a medicament for diagnosing or treating conditions responsive to the antibody or PRO

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to three hundred and five nucleic acids encoding PRO polypeptides (secreted and transmembrane). Methods and compositions of the present invention are useful for the diagnosis, prevention and/or treatment of tumours, such and an advantage and transpectation or liver tumours. The PRO polypeptides are also useful as molecular weight markers, or for chromosome identification. The PRO genes are useful as hybridisation probes, or for screening libraries of human CDNA, genomic DNA or mRNA. The PRO genes may also be used in gene therapy, particularly for replacing a defective gene. The present sequence represents a human PRO polypeptide of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Three hundred and five nucleic acids encoding secreted and transmembrane PRO polypeptides, useful for the diagnosis, prevention and/or treatment of tumors, such as adrenal, lung, colon, breast, prostate, rectal,

The invention relates to an antibody that binds to a secreted or transmembrane protein designated PRO1446 appearing as ABO33941. The protein is one of 84 PRO polypeptides which (along with their encoding nucleic acids) are disclosed in the specification. The methods and compositions of the present invention are useful for the preparation of amedicament for the treatment of disorders associated with the aberrant expression or activity of the PRO polypeptide, such as tumour conditions and cancer. They can also be used to generate transgenic or knockout animals useful in the development and screening of therapeutically useful reagents. The PRO polypeptides and encoding nucleic acids can be used as molecular weight markers for protein electrophoresis, chromosome identification and tissue typing. The antibodies may be used in various diagnostic, competitive binding and/or immunoprecipitation assays. The present sequence represents a PRO polypeptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New isolated antibody specifically binding a PRO polypeptide, useful for the preparation of a medicament for treating disorders with the aberrant expression or activity of the PRO polypeptide, such as tumor conditions and cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Claim 14; Fig 14; 223pp; English.
